INSIGHTS ON USING BRIGHTWAY2 WITH ENERGY SIMULATIONS

How Brightway2 has facilitated the design and assessment of small scale energy systems

French commission for
atomic and alternative
energies

LSED – Laboratory of
energy systems and
demonstrations

ENERGY SIMULATIONS: LCA INDICATORS MISSING

Technology inputs

- Components, models (performances, ageing) and parameters (ex: sizing, costs)

Control strategy

Case specific inputs

Weather, energy demand time Series

SIMULATION

**GLOBAL
SENSITIVITY
ANALYSIS
+
OPTIMIZATION**

Outputs

- Simulation results specific to each component (time series, mass/energy balances, statistics)

- System Performances Indicators

Technical indicators

Use rate of RE potential, system footprint, load satisfaction rate, etc.

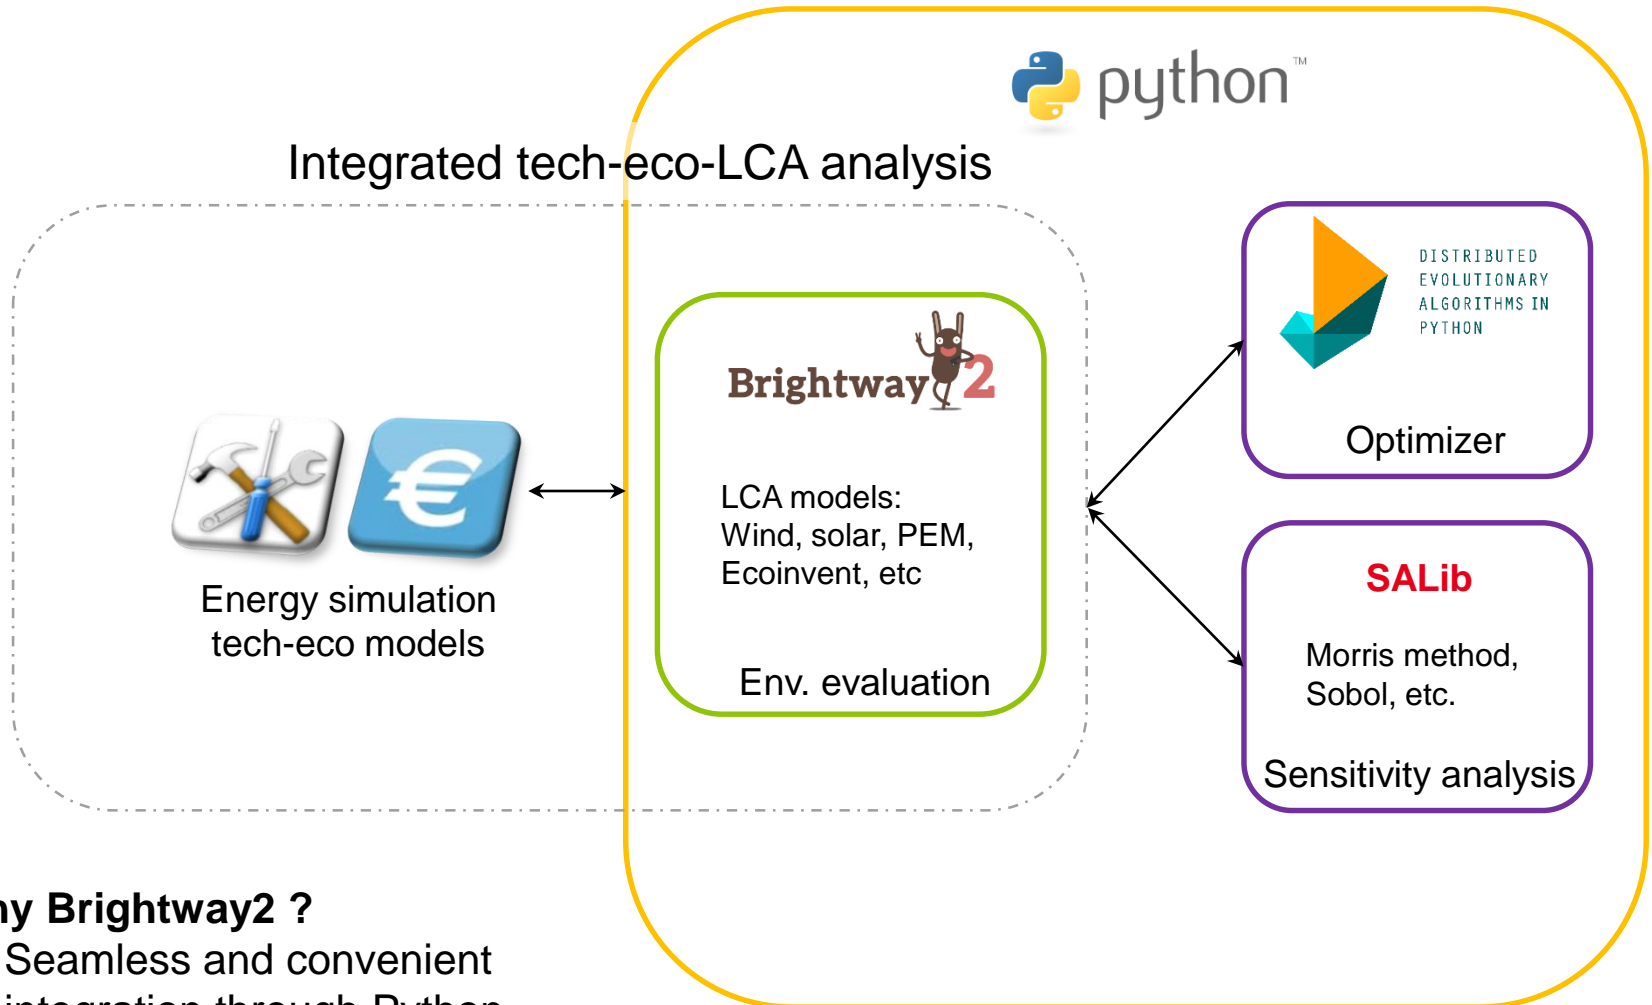

Economic indicators

Investment costs, payback time, profit, etc.

How to add environmental analysis ?

SOFTWARE ORGANISATION

Why Brightway2 ?

- Seamless and convenient integration through Python
- Access to python libraries

APPLICATION: CASE STUDY

Context:

Hydrogen production

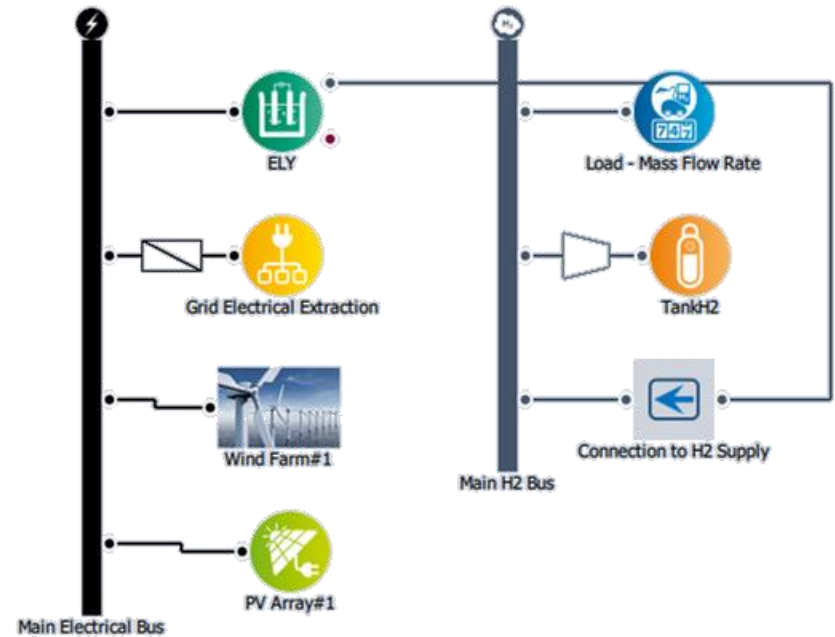

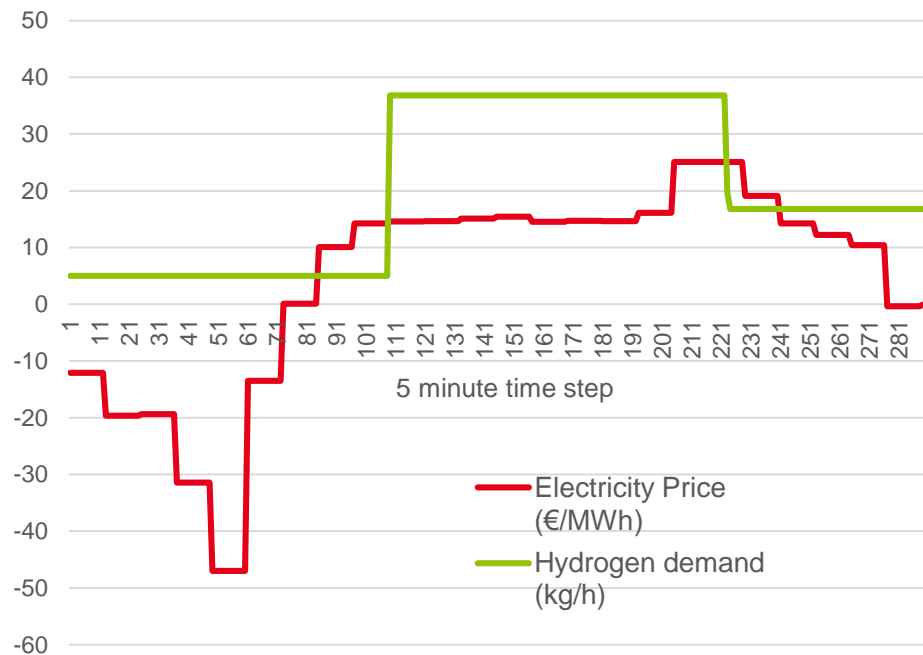

Aim:

Optimise the system size to save money

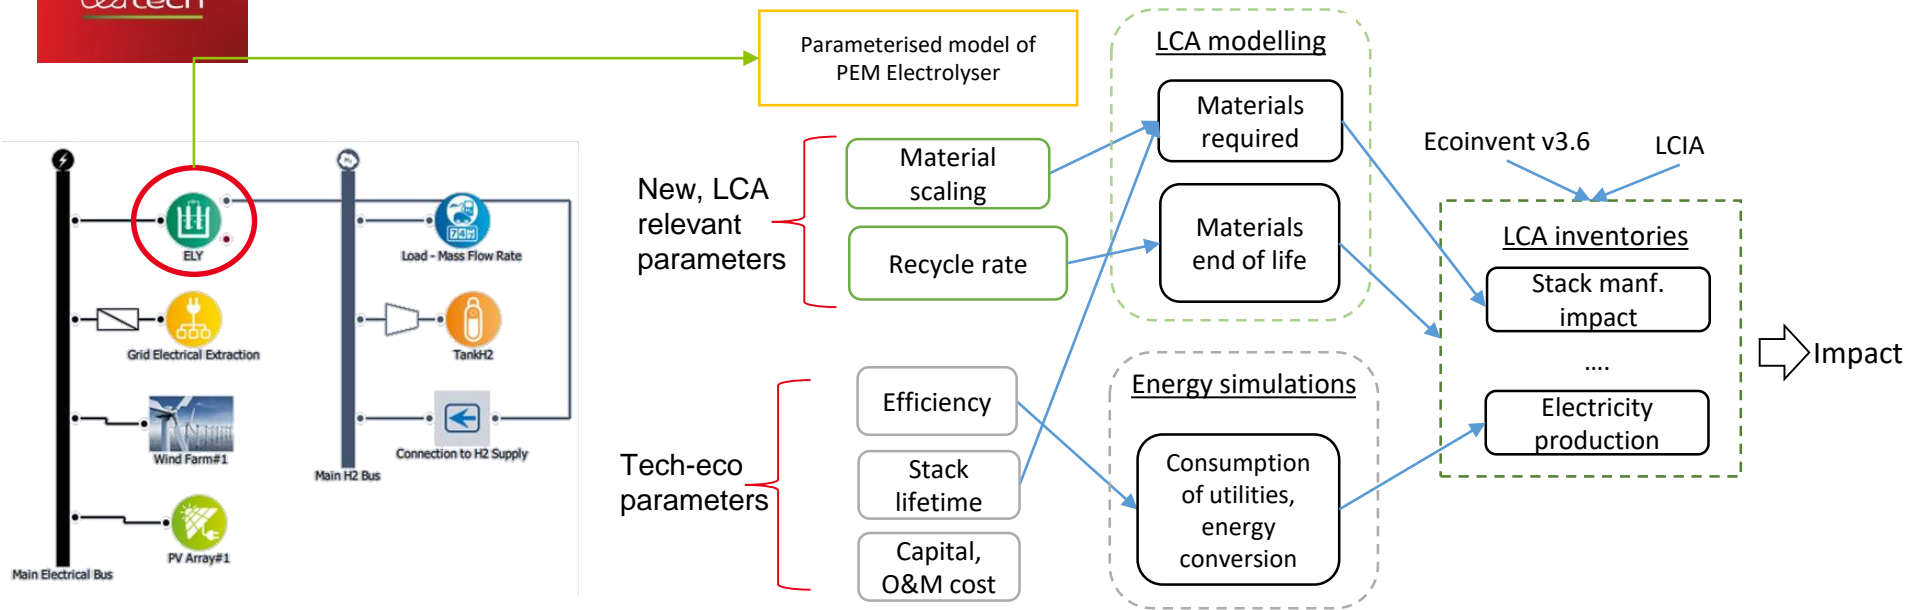

Constraints:

Variable electricity price

Variable load demand

SENSITIVITY & IMPORTANCE INDICES

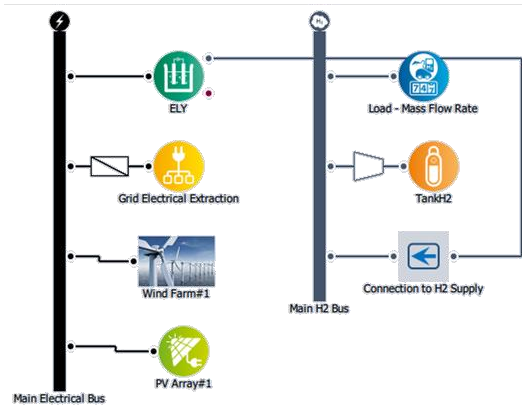

Sensitivity indices

Importance indices = Sensitivity indices × impact contributions

	Climate change	Terrestrial acidification	Particulate matter formation	Mineral resources use
market for titanium, primary	0.00	0.04	0.04	0.00
market for tetrafluoroethylene	0.00	0.00	0.00	0.00
market for activated carbon, granular	0.00	0.00	0.00	0.00
market for platinum	0.02	2.04	0.79	0.01

SIZING WITH TECH – ECO INDICATORS

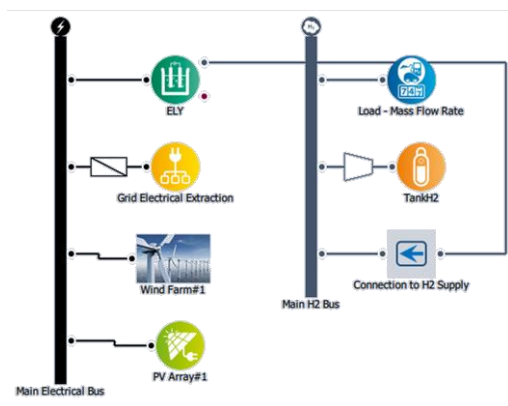

Exclusion of low-carbon sources in the design alternatives if LCA indicators are not included

Electrolyser	0,9 – 1,24 MW
No. of tanks	11 – 26
Wind	0 MW
Solar PV	0 kW
Carbon footprint	~ 4,85 kg CO ₂ -eq/kg H ₂

SIZING WITH TECH – ECO – LCA INDICATORS

Inclusion of low impact configurations in the design alternatives

Electrolyser	0,8 – 1,24 MW
No. of tanks	3 – 26
Wind	0 – 1,6 MW
Solar PV	0 – 500 kW
Carbon footprint	2,3 - 4,85 kg CO ₂ -eq/kg H ₂

DECISION-MAKING: TRADE-OFFS BETWEEN INDICATORS

$$\frac{I_{abs} - I_{min}}{I_{max}}$$

ACKNOWLEDGEMENTS

- Brightway2 (obviously 😊) and the online community
- Activity browser
- Deap evolutionary algorithms
- SALib sensitivity analysis
- Parameterized wind models

Thank you, life is much easier with you !

Let's continue the sharing chain !

THANK YOU FOR YOUR ATTENTION 😊
